

- Is there a minimum position size to use (ie. minimum dollar value)?
- 3) Is there a maximum position size to use?
  - 4) What does it matter?

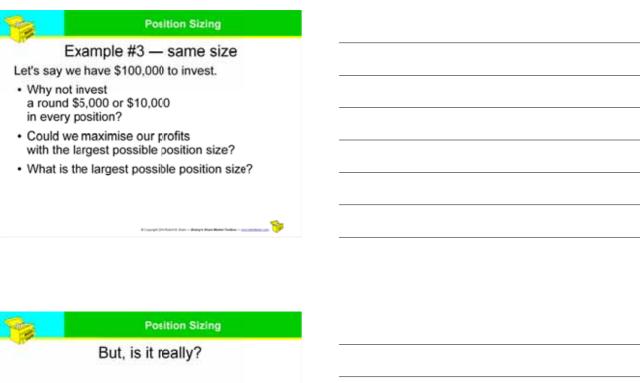

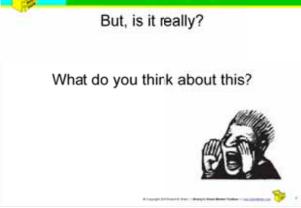

What about the impact of brokerage and slippage?

R

#### The experts say:

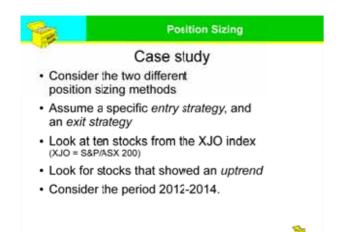

- Position sizing is very important and if applied correctly, it can dramatically improve your strategy performance and help you avoid ruin ("optimise").
- The consequences of not doing it:
- · Too much of the capital at risk.
- · Losses could be higher.
- · Not enough of the capital at risk.
- · Potential profit could have been greater.
- Additional positions / investments might have been possible (ie. extra opportunties).

Option (1) Ten parcels of \$10,000 each ie. Fixed Dollar Amount Option (2) Utilise the "2 Percent Rule" to optimise the position sizes.

(2) - Fixed Risk per trade

Use these money/risk management rules:

- Use the "2 Percent Rule" to "risk" no more than 2% of total capital (see explanation, next slide)
- Have no more than 20% of total capital allocated to any one position.
